ABSTRACT

Platespotter is a web-based food discovery platform designed to help people explore restaurants and cafes in Hyderabad, Pakistan. It provides a simple and centralized way for users to find food places, read reviews, view specialties, and save favorites. The application is built using ASP.NET Web Forms, C#, SQL Server, and Tailwind CSS for a modern and responsive experience.

The system includes features like user authentication, search and filtering, favorites management, and user-submitted cafes. Platespotter aims to solve the issue of scattered food information by offering a clean and organized digital guide. The project demonstrates full-stack development skills and provides a scalable base for future enhancements.

INTRODUCTION

Platespotter was created to make food discovery easier for the people of Hyderabad. Although the city has a rich and diverse food culture, there is no single platform where users can view updated details about restaurants, specialties, prices, and reviews. People often rely on inconsistent information from social media or word-of-mouth.

The platform provides an organized list of restaurants, along with categories, reviews, and a powerful search system. Users can also save favorite places and submit new cafes, helping build a community-driven database.

The main goal of Platespotter is to offer a reliable, visually appealing, and easy-to-use food guide that supports both users and local businesses. The project focuses on accessibility, modern design, and seamless functionality across different devices.

RESULTS AND DISCUSSION

Platespotter's system follows a simple architecture consisting of the user interface, backend logic, and database.

USER INTERFACE:

The **user interface** uses ASP.NET Web Forms with Tailwind CSS to create a clean layout that works well on mobiles and desktops. Users can browse restaurant cards, filter by categories, and interact with features like reviews, submissions, and favorites.

BACKEND:

The **backend** is built with C#, handling user authentication, search operations, session management, and event-based actions such as adding favorites or loading restaurant lists.

DATABASE:

The **database** uses SQL Server with structured tables for users, favorites, and user-submitted cafes. This ensures organized storage of login details, saved restaurants, and submitted entries. Indexing and optimized queries help improve search speed and overall performance.

Security measures such as input validation and parameterized queries protect the system from common vulnerabilities. Tailwind CSS ensures a consistent, responsive, and modern design throughout the platform.

Overall, Platespotter successfully brings together functionality, design, and usability into a unified food discovery experience.

CONCLUSION

ACHIEVEMENTS:

Platespotter achieves its goal of creating a simple, organized, and modern food discovery platform for Hyderabad. It includes essential features like secure login, restaurant listings, reviews, search filters, and a responsive design. The system effectively integrates frontend, backend, and database components to provide a smooth experience.

LIMITATIONS:

However, it also has some limitations, such as using sample data, supporting only one city, and missing features like real-time updates or social interactions. These areas offer room for improvement.

FUTURE ENHANCEMENTS:

In the future, the project can be expanded with mobile apps, live reviews, maps integration, advanced search options, social features, an admin panel, and multi-language support. With further development, Platespotter has the potential to become a complete digital food guide for the region.
